

- Discrete view of Poisson process: split time into small intervals  $\Delta t$ , each treated as a Bernoulli trial with  $p = \lambda \Delta t$  (an event occurring in  $\Delta t$  is treated as a success).
- Sum of  $m$  i.i.d. Geometric ( $p$ ) random variables is Negative Binomial ( $m, p$ ).
- Sum of  $m$  i.i.d. Exponential ( $\lambda$ ) random variables is Erlang ( $m, \lambda$ ).
